How can I test my own website for compliance?

- Use a GPC browser such as Duck Duck Go or Privacy Badger Chrome extension and (separately) make a DNS request, making sure it respects the former and that the latter is compliant and prominent.
- Look at the cookies that were loaded in a session without GPC and one with GPC. Ensure any that could potentially be considered a sale are not loaded.
- Log into your site and repeat above after processing a DNS.
- Look inside your privacy tool to see if the request treated like a DNS.
- How was it handled for a logged in, known user if there is a conflict?
- Was the separate DNS request completed successfully in your privacy tool?
- Were any downstream notifications required & triggered? Do you have a log of such, or can you provide evidence this was respected?
- Do you have a prominent mechanism to receive requests?
- Did you post reporting as required?
- Is your privacy policy reflective of the sessions above?
